(54) Title: **ARTHROPLASTY IMPLANT**

(57) **Abstract:** The invention concerns an arthroplasty implant for providing a joint between first and second members of the body, such as a metatarsophalangeal (MTP) joint, a metacarpophalangeal (MCP) joint or a proximal interphalangeal (PIP) joint. The implant of the invention includes a first component (10) defining a concave surface (14), a second component (20) defining a convex surface (24) and an intermediate component (32) which is located between the first and second components. The intermediate component has a convex surface (36) which is slidable on the concave surface of the first component to allow articulation between the first component and the intermediate component and a concave surface slidable on the convex surface of the second component to allow articulation between the second component and the intermediate component. A means (16, 38; 50, 60) is provided to prevent the intermediate component from separating laterally from at least one of the first and second components.
